ABSTRACT:

   PROBLEM TO BE SOLVED: To provide a structured document editing method which
can automatically generate such a dynamic input form that elements which should
be inputted change with the contents of elements and eliminates the need to
correct and develop a program.

   SOLUTION: This method has a structured document analysis step for **generating**
a document structure tree wherein the relation between elements in a stored
structure document is represented in tree structure, a restriction elimination
step for operating the document structure tree according to editing contents
inputted from an input device so that document rules prescribing restrictions
regarding the structure and contents of the document are referred to and met,
and a picture display step where a document picture is **generated** from the
document structure tree processed at the restriction elimination step by
referring to a **style sheet** specifying information regarding a document style

needed for the picture display and **printing** of the structured document and displayed at the display device.
